

## *Portrait Plasma Skin Regeneration*

*A new dramatically different,  
clinically proven treatment.*

Treats 100% of the skin for the results you expect

Portrait Plasma is unlike any other treatment available today. It uses next generation technology, plasma energy, and it is the first and only cosmetic treatment proven to deliver true regeneration of a natural collagen and elastin structure of the skin thereby improving contours, tightening skin, smoothing wrinkles and enhancing your overall appearance. *It's like turning back the hands of time.*

While some treatments lead to modest improvement only at the skin surface or to a fraction of the skin, clinically proven Portrait Plasma distinctively alters structures at and below the surface, creating the right conditions for the continuing skin regeneration and dramatic improvements in fine and deep wrinkles, skin laxity, acne scars, tone, texture and discoloration. The energy of Portrait Plasma uses heat to treat 100% of the targeted area without direct contact with the skin. Plasma Energy uniquely preserves the skin's outer layers which act as a protective dressing until your new healthy skin regenerates.

*How soon will I see a difference?*

*How long will it last?*

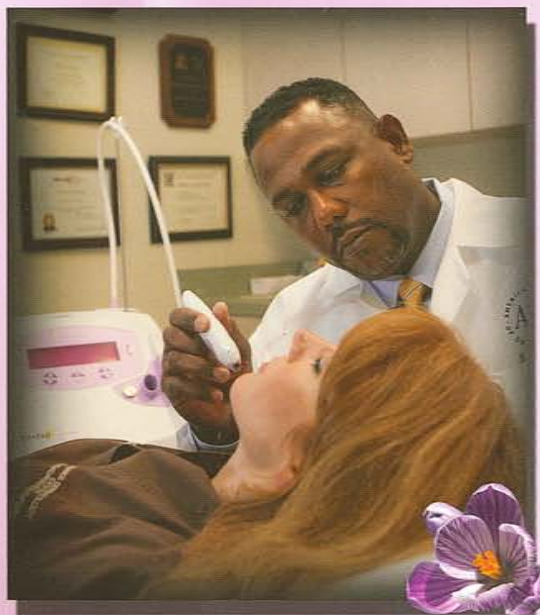

Following recovery time you will see a more even skin tone, smoother texture and diminished fine lines and pigmentation.

Your deeper wrinkles and acne scars will diminish as the collagen and elastin fill in about three months after the procedure. One of the most striking and unique advantages of Portrait Plasma is that it stimulates a natural recovery process of skin regeneration, producing results that progressively improve over time. Clinical studies show the improvement can be seen for at least two years after treatment. Patients are amazed when they compare their appearances before treatment and two years later.

*True skin regeneration for smoother,  
tighter, more beautiful skin.*

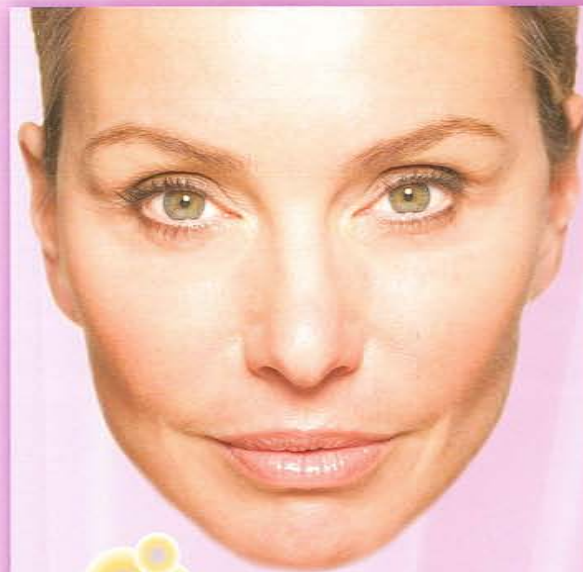

*Treat the full face, upper/lower  
eyelids, and around the mouth.*

Portrait Plasma skin regeneration begins with a simple procedure after which you will see tightening, improvements in your skin tone & texture and diminished wrinkles. Portrait Plasma treated skin continues to improve through intense activity by fibroblasts in the skin that form new, natural collagen and elastin structures, not seen with laser, fractionated and light source technologies. This improved skin architecture provides sustainable improvements in wrinkles and acne scars enhanced by a natural, tighter, more vibrant and youthful appearance.

in Skin Care*

*Smooths away fine  
lines and deep wrinkles*

*Tightens lax skin*

*Improves acne Scars*

*Enhances skin tone  
and texture*

*Dramatically Different*

*Clinically Proven*

## What makes Portrait Plasma different from other treatments?

The ground breaking science behind Portrait Plasma makes it different from other treatments in several important ways. Portrait Plasma is the first and only treatment clinically proven to regenerate natural collagen and elastin structure - the basis of youthful skin. 100% of the skin is treated initiating regeneration deep below the surface, remodeling a natural skin architecture which replaces the damaged, wrinkled layers naturally. And the results have been clinically proven to last for two years after treatment.

## Can Portrait Plasma tighten upper and lower eyelids?

Yes. The results seen from clinical studies and ongoing clinical use clearly demonstrates significant tightening of lax skin and wrinkle reduction around the eyes.

## What kind of Improvements Can I expect to see?

You will see improvements in skin texture and tone and reduction of fine wrinkles at lower energy levels of treatment and reduction of deep wrinkles and acne scars at higher energy levels of treatment. New healthier, natural collagen growth will improve contours, tighten your skin, and enhance your overall appearance.

## What does it feel like and how long does it take?

You may experience a localized sensation of heat during the procedure. A topical anesthetic is generally applied before the procedure, although your physician may recommend other approaches for comfort depending upon your specific needs. After preparation, a full face treatment usually takes around one hour.

## What is Portrait Plasma and How does it work?

The innovative FDA-cleared Portrait Plasma procedure is the first and only technology proven to deliver true skin regeneration. It employs nitrogen based plasma energy that transfers heat to the skin using a non-contact technique.

## How many treatments do I need?

Only one treatment is needed.

## What should I expect following treatment?

The outer layer of skin browns and is shed 5-7 days after treatment. Once this occurs, the redness of the regenerated skin will last a few weeks. Localized redness may linger slightly for some patients. On darker skin, the localized redness may appear as a darker spot that lightens over time. A total recovery time typically lasts from seven to ten days.

## Is the Portrait Plasma procedure safe?

In clinical studies Portrait Plasma has demonstrated an excellent safety profile. The study patients have not shown protracted periods of downtime, scarring, hypopigmentation, or prolonged hyperpigmentation associated with other light or ablative resurfacing laser treatments. Portrait Plasma is FDA-cleared to treat wrinkles, superficial skin lesions, actinic keratosis and acne scars of the face and body.

## Can Portrait Plasma be used with other treatments?

Your physician will advise you on the best way to combine treatments such as Botox or dermal fillers. Many physicians are also combining Portrait Plasma with facelifts and liposuction as well as re-treating regional areas such as the eyes for patients looking for more results. If you have had other procedures within the last twelve months you should discuss the timing of Portrait Plasma with your physician.
